EXECUTIVE SUMMARY

The Web-based HOAConnect: An Automated Homeowners' Association Fee Collection and Budget Transparency System for Mabuhay Homes 2000 in Barangay Paliparan II, Dasmariñas City, Cavite aims to modernize and simplify the fee collection process for homeowners and association officers. This system automates monthly dues collection and provides online payment options through digital platforms such as GCash and bank transfers, offering homeowners a more convenient and accessible way to settle their payments. Beyond payment collection, HOAConnect enhances financial transparency by allowing users to view updates on total collected funds, project allocations, and expense reports. It also enables administrators to verify payments, issue receipts, and send automated notifications through email. The system ensures that every transaction is properly recorded and easily traceable, promoting accountability within the community.

APPROVAL SHEET

This capstone project proposal titled *HOAConnect: An Automated Homeowners' Association Fee Collection And Budget Transparency System For Mabuhay Homes 2000, Barangay Paliparan II, Dasmariñas City, Cavite* prepared and submitted by **Mark John S. Castillo, Raemel Gerard M. Copon, Gio Iverson A. Rodriguez, and Marj Celine A. San Jose**, in partial fulfillment of the requirements for the degree of Bachelor of Science in Information Technology, has been examined and is recommended for acceptance and approval.

Mr. John Kristopher B. Adan

Information Technology Project Adviser

Accepted and approved by the Capstone Project Review Panel in partial fulfillment of the requirements for the degree of Bachelor of Science in Information Technology

Mr. Joeren C. Jarin, MIT

Panel Member

Ms. Micaella M. Empeño

Panel Member

Mr. Jason A. Sespeña, MIT

Thesis Coordinator, Lead Panel Member

ACKNOWLEDGEMENT

The researchers would like to express their deepest gratitude to all those who contributed their time, support, and guidance throughout the completion of this capstone project, PCU-Dasma Connect: A Web-Based Alumni Engagement and Partnership Platform.

First and foremost, sincere thanks to our Almighty God for granting us wisdom, patience, and perseverance during every stage of this research and development journey.

To our capstone adviser, Ms. Micaella M. Empeño, thank you for your continuous guidance, valuable insights, and constructive feedback, which helped shape and improve the quality of our work.

We would also like to thank the Office of External Affairs and Alumni Relations of Philippine Christian University – Dasmariñas Campus for allowing us to align our system with the needs of the institution. Special thanks to the administrative staff and faculty who supported us with data, validation, and encouragement.

To the alumni respondents, institutional partners, and IT experts, your participation and feedback were crucial in evaluating the system and ensuring that it serves its intended users effectively. We are grateful for the time and knowledge you shared.

A heartfelt thank-you to our families and friends, whose understanding, prayers, and unwavering support inspired us to keep going even during challenging moments.

CHAPTER I

INTRODUCTION OF THE STUDY

PROJECT CONTEXT

Mabuhay Homes 2000, a subdivision located in Barangay Paliparan II, Dasmariñas, Cavite, currently relies on manual procedures for collecting monthly dues and amenities fees from homeowners and renters. The method not only consumes much time but is also prone to errors, where it would be difficult to keep track of records and finances accurately. With transactions processed manually, payments are sometimes miscalculated and fail to be recorded altogether. Consequently, many residents either forget to pay or intentionally neglect to do so, largely because they consider the monthly dues of fifty pesos too minor to prioritize. Some dismiss it as a minor expense, while others show little interest about how their contributions are spent. The monthly due of fifty pesos and amenities fees are used for the construction of speed humps, garbage collection, and other renovations needed inside the subdivision. The lack of clear and transparent payments and budget expenses leads to a lack of trust in the process.

To address these challenges, the researchers aim to develop HOAConnect: An Automated Homeowners' Association Fee Collection and Budget Transparency System for Mabuhay Homes 2000. This platform aims to benefit homeowners as well as HOA administrators with more streamlined, sometimes convoluted fee collection and record-keeping procedures. Homeowners will get the advantage of having an easy-to-use facility online, an online payment option complete with features such as GCash payment or bank transfer, where paying dues can be easily done at their convenience. The homeowners also have a cash payment option if they want to pay walk-in. They will also be able to upload a proof of payment which is a screenshots or photo of their receipts for verification and receive payment confirmation through email, so each transaction is tracked.

Philippine Christian University

College of Informatics

Beyond payments, the system provides a clear view of the total collected fees, with full visibility into where these funds are being expended. Additionally, the system has a user-friendly interface to make it easy for users to navigate the system, especially the elderly. It has an activity calendar where users can track the upcoming events. HOAConnect will automate many tasks for HOA administrators, enabling them to work more efficiently, be more effective, and build trust inside the community. The system will automate bills, adding the unpaid balances, and give updates on collected monthly dues and other important details. It tracks down unpaid fees and notifies homeowners via email when payments are due or when new announcements are posted to keep everyone informed. Homeowners who are unable to create an account in the system due to using a keypad phone will still have their records maintained. The admin will manually update their payments made through walk-in transactions, ensuring that all transactions are properly recorded and tracked. Each household is limited to having one registered account in the system.

Moreover, HOAConnect will highlight the specific responsibilities of key HOA officers, further enhancing transparency, accountability, and homeowner engagement. The president will have an overview of the system's transactions, ensuring effective oversight of systems operations. The system will allow the treasurer to efficiently manage budget releases, and verify remittances to monitor the inflow and outflow of HOA funds. It will also enable the auditor to publish detailed liquidation reports on projects, ensuring that financial records remain transparent and that homeowners are informed about how resources are utilized. In addition, the secretary will be able to create project resolutions and post completed HOA projects and event announcements, keeping residents well-informed and actively involved in community initiatives. Security will remain the top priority, ensuring that sensitive information is accessible only to authorized HOA administrators; thus, confidentiality is maintained while transparency is promoted. With these features, the system aims to foster a more organized, transparent, and connected Mabuhay Homes 2000 community.

STATEMENT OF THE PROBLEM

General Problem

The Mabuhay Homes 2000 subdivision in Paliparan II, Dasmariñas City, Cavite continues to rely on manual processes for collecting monthly dues and amenities fee from homeowners and renters. How can the collection process and budget transparency in Mabuhay Homes 2000 be improved through the development of web-based HOAConnect: An Automated Homeowner's Association Fee Collection and Budget Transparency System?

Specific Problem

1. What features should be included in a module that allows account creation for both administrator and homeowners?
2. How can the system effectively notify homeowners about payments, deadlines, posts, and event announcements through email?
3. How to develop a module that will facilitate online payment methods for monthly dues collection?
4. How can the system provide immediate updates on the status of collected HOA fees?
5. How to develop a module that allows admin to verify payments?
6. How can the system support the uploading of pictures and PDF files by the administrators?
7. How to develop a module that streamlines record-keeping and automates billing?
8. How can the system allow the auditor to publish liquidation reports of the projects for enhanced financial transparency?
9. How can the system allow the admin to record the amenities information and payments?

Philippine Christian University

College of Informatics

10. What is the evaluation of the homeowners and HOA administrators in terms of:

- A. Functional Sustainability
- B. Usability
- C. Reliability
- D. Portability
- E. Security
- F. Performance Efficiency
- G. Compatibility
- H. Maintainability

OBJECTIVE OF THE STUDY

General Objective

The general objective of this study is to design, develop, and implement a web-based HOAConnect: An Automated Homeowners' Association Fee Collection and Budget Transparency System in Mabuhay Homes 2000 Barangay Paliparan II, Dasmariñas City, Cavite. The system aims to streamline the collection of fees, improve record keeping, and provide updates on collected payments. It will be a user-friendly website; it also offers online payment, automated reminders, updates on HOA projects, and the auditor will release the detailed documentation of fund allocation.

Specific Objectives:

1. To develop a module for account creation for both administrators and homeowners.
2. To develop a notification module that will alerts homeowners about payments, deadlines, posts, and event announcements through email.
3. To develop a secure module that will facilitate online payment methods for convenient fee collection.
4. To provide immediate updates on the status of collected fees.
5. To develop a module that allows admin to verify payments.
6. To develop a module that will enable the administrators to upload images and PDF files in the system for information dissemination.
7. To develop a module that streamlines record-keeping and automates billing.
8. To develop a module that allows auditor to publish liquidation reports of projects for enhanced financial transparency.
9. To develop a module that allows admin to record the amenities information and payments.

Philippine Christian University

College of Informatics

10. To determine the evaluation of the homeowners and HOA administrators in terms of:

- A. Functional Sustainability
- B. Usability
- C. Reliability
- D. Portability
- E. Security
- F. Performance Efficiency
- G. Compatibility
- H. Maintainability

Philippine Christian University

College of Informatics

SETTINGS OF THE STUDY

This The study will be conducted within the confines of the Mabuhay Homes 2000 subdivision located at Barangay Paliparan II, Dasmariñas City, Cavite, during the school year 2024-2025. The study involves both the homeowners' association officers and the homeowners.

SCOPE AND LIMITATIONS OF THE STUDY

Scope:

- **President Interface Module:** This module manages the design and layout of the web pages that the super admin interacts with. It includes creating and managing the accounts of HOA administrators, ensuring only authorized personnel can access administrative tools, and overseeing system-wide settings for security and functionality.
- **Admin Interface Module:** This module manages the design and layout of the web pages that admin interacts with. It includes creating homeowners' account, monitoring unpaid fees, verifying payments, recording the amenities payment, updating the treasurer on remitting collected money, and posting announcements.
- **Secretary Interface Module:** This module manages the design and layout of the web pages that the secretary interacts with. It includes creating project resolutions and posting announcements.
- **Treasurer Interface Module:** This module manages the design and layout of the web pages that the treasurer interacts with. It includes verifying the remittance of money from the admin, updating the inflow and outflow of funds for HOA projects, and monitoring payment history.
- **Auditor Interface Module:** This module manages the design and layout of the web pages that the auditor interacts with. It includes generating expense liquidations reports that show detailed expense allocations, ensuring the accuracy and compliance of financial records.
- **Homeowners Interface Module:** This module manages the design and layout of the web pages that homeowners interact with. It provides a user-friendly interface specifically for paying monthly dues via online payment, including uploading proof-of-payment. It also includes access to updates on total collected fees, can see the projects fund allocation documentation, and notification through email.

- **Account Creation Module:** This module manages the creation of user accounts based on specific roles within the system. The President is responsible for creating accounts for the administrators, ensuring that only authorized individuals can access administrative features. Once an admin account is set up, the admin can create accounts for Homeowners. After an account is created, the user's login credentials are automatically sent to their email address.
- **Payment Module:** This module manages the payment process of monthly dues and amenities, supporting both online and walk-in payments. Homeowners can also upload photos of their proof of payment for verification.
- **Budget Transparency Module:** This module manages updates of the HOA's collected fees, which are visible to all users, and allows homeowners to view the fund allocation for every project implemented by the association. It also includes a Project and Financial Resolution section that displays fund releases and project plans, keeping homeowners informed. After a project or transaction is completed, the auditor will release the detailed liquidation reports that show expense allocations, which homeowners can access within the system.
- **Record Keeping and Billing Module:** This module manages the automatic charging of monthly dues to homeowners. It also keeps the record of user's personal information, payments, and their transactions.
- **Notification Module:** This module manages the sending of automatic notifications to the users through email.
- **Web Interface Module:** This module manages communication between the web-based interface and back-end system, allowing the users to access online payment, total collected fee, budget allocation, and notifications.
- **Database Management Module:** This module manages storing and retrieving of user data as well as other information such as: user profiles, payment records, financial reports, media, and announcement.

Philippine Christian University

College of Informatics

- **Security Module:** This module manages the security features of the system, including encryption, access control, and verification.

Limitation:

- **Limited Accessibility:** This accessibility of the system is only limited for Mabuhay Homes 2000 homeowners and administrators.
- **Restricted Accessibility:** Some users, particularly elderly homeowners or those persons with disabilities, may encounter limitations in accessing the system.
- **Limited Language Support:** The system may lack support to multiple languages, thus limiting its usage in other countries.
- **Reliance on Network Connectivity:** The system's functionality depends on network infrastructure, which may pose challenges if the network is limited availability or unstable.

SIGNIFICANCE OF THE STUDY

The development of HOAConnect: An Automated Homeowners' Association Fee Collection and Budget Transparency System for Mabuhay Homes 2000 Subdivision in Barangay Paliparan II, Dasmariñas City, Cavite, aims to simplify fees collection, improve record-keeping, provide updates on collected payments, and promote transparency by posting the documentation of how funds are allocated. The result of the proposed system will be a great benefit for the following:

1. Homeowners: This system is specifically designed for the residents of Mabuhay Homes 2000, with the goal of enhancing their engagement and satisfaction with HOA processes. It provides homeowners with a simple and accessible way to pay their monthly dues through online options such as GCash and bank transfers, including the ability to upload proof of payment. The system promotes transparency by offering features such as immediate updates on HOA-collected fees, updates on the release of funds for projects, and release of project liquidation reports detailing expense allocations. Homeowners will also receive payment confirmations and automated reminders via email. These features help build trust and accountability within the Mabuhay Homes 2000 community.

2. HOA Officers: The system will provide HOA officers with tools to fund manage efficiently. The transparent budget, for instance, will allow the officers to work on planning in the community without having to conduct manual record keeping. Immediate updates on payments and expenditures will help them make informed decisions to improve the subdivision.

3. HOA Administrators: The system streamlines monthly dues collection and administrative responsibilities by automating billing, tracking unpaid fees, and enhancing record-keeping processes. Administrators will no longer need to rely on manual payment records, as the system provides data and notifications to homeowners. Additionally, it enables administrators to upload announcements with images, detailed documentation of completed projects, and project liquidation reports that show detailed expense allocations, thereby improving transparency with residents.

4. Future Researchers: This study is a significant factor for future researchers because once it proves to be effective in the Mabuhay Homes 2000 Homeowners Association, they can build upon it. It will greatly help them understand how an automated fee collection and transparency system works, including features such as online payment, and updates on collected fees. The study also allows for the adoption of existing research and encourages further improvements or enhancements, such as adding new features that can benefit not only Mabuhay Homes 2000 but also other communities.

5. Developers: This study will help us as a college student or as a developer by improving our knowledge in critical thinking. We will learn to think creatively to handle and solve challenges that we may encounter once we implement the study. It will also teach us to base on the needs of our users or clients because they will be the ones using our proposed project. Additionally, it will help developers like us to analyze the process before start doing a project. We need to understand the purpose of the study and who will be using it. By recognizing our users and understand their abilities, we can adjust our system accordingly. We will bring these experiences in the future once we are working in the industry.

DEFINITION OF TERMS

To prevent misunderstandings and establish a common understanding of the terminology used in the study, the following terms are defined in practical terms.

Administrators: The president, secretary, admin, auditor, and treasurer of HOA officers that manage the system.

Functional Sustainability: The system's ability to work efficiently over time without frequent maintenance or major issues.

HOA Fees: These are the monthly dues paid by homeowners, as well as fees collected from amenity rentals. The available amenities include the court, parking spaces, and stalls for rent in Mabuhay Homes 2000. The collected fees are used for the construction of speed humps, garbage collection, and other necessary renovations within the subdivision.

Homeowners: A person who owns a house that they live in.

Homeowners Association (HOA): A group that manages a residential community like subdivision or condominium. It sets rules, collects fees, and maintains common areas like parks, gates, and security.

Online payment: Paying money via internet using cards and digital wallets.

Portability: The system's accessibility on different devices like mobile phones, tablets, and computers.

Proof of Payment: A document that shows evidence of payment transaction.

Reliability: The system's ability to function correctly and consistently without errors.

Philippine Christian University

College of Informatics

Security: The system's ability to protect user data and ensure only authorized people can access it.

Usability: How easy to navigate the system is for homeowners and administrators.

Web-based: The program is accessible through a web browser on any device with internet connection.

CHAPTER II REVIEW OF RELATED LITERATURE

A literature review means a careful study of past research undertaken within a specific topic. This process involves examining academic articles, books, and other connected resources to the chosen study. When reviewing related literature for a thesis or scholarly study, individuals carefully assess literature, concentrating and focusing on the most recent findings and materials that relate to their research study.

LOCAL LITERATURE

Villa Palao Subdivision Homeowners Association Management System with E-mail Notification

According to Alvara, Amante, and Paurom (2023), the main goal of a Homeowners Association Management System is to streamline and enhance the management of residential communities. The study focuses on creating a system that will automates the administrative tasks and incorporates an email notification feature.

Alvara, Amante, and Paurom also addressed the challenges faced by homeowners' associations, such as poor record keeping, slow communication, and manual processing of transactions, it calls the need for a more efficient management system. The proposed management system with an email notification feature makes tasks easier: from the collection of monthly fees to keeping residents' records and sending important announcements. This feature enhances communication between HOA officers and residents by sending timely updates about payments, meetings, and community events.

The ideas presented in the study demonstrate how essential it is to have a competent HOA management system. This system helps streamline and organize the work processes of a homeowners' association. It also serves as a vital communication bridge between HOA officers and residents, promoting transparency and making the management of residential communities more efficient.

Improving the Financial Sustainability of a Homeowners' Association

According to Florendo (2021), the important factors that keep a homeowners' association financially stable are the efficient collection of monthly payments and proper financial management. Financial stability supports the daily operations of an HOA, and the adopting digital tools can help to achieve this goal. The study identifies common issues faced by homeowners' association, such as difficulty tracking finances and delayed payment of monthly dues, which can be solved by using online payment methods and sending billing through a statement of account to delinquent homeowners.

Florendo emphasized the importance of having a more organized and efficient way of handling finances and payment collection for homeowners' associations. In the study, statements of billing were sent to homeowners, and GCash was introduced as an alternative online payment option. The method makes it more convenient for the residents to settle their monthly dues anytime and anywhere while also simplifying financial processes for HOA officers. The use of digital tools in financial management and fee collection plays a vital role in effectively operating homeowners' associations, as these strategies streamline administrative tasks and enhance the overall experience for both HOA officers and residents.

Web-based Fund Collection System

According to Agtina et al. (2024), a web-based fund collection system was developed for a military organization in Zamboanga del Sur, Philippines, to improve the manual payment process in its Accounting and Finance offices. The study tackles problems such as slow transactions, errors in recording payments, and delays in issuance of payment orders and receipts.

The researchers demonstrated that using a digital system makes payment collection faster, reduces errors, and provides clear financial reports through visual representation such as graphs. The system was developed using tools including HTML5, PHP, MySQL, JavaScript, and Bootstrap, and adheres to ISO 25010 standards to ensure usability, reliability, and security. The Waterfall Model guided the development process, and feedback from users confirmed the system is both simple and effective.

This study highlights the benefits of implementing web-based system to improve financial operations. By addressing these challenges, the system enhances administrative work become more efficient and improve service to the clients, proving its relevance and value for community-based organizations.

The ideas presented in the study demonstrate how essential it is to have a competent HOA management system. This system helps streamline and organize the work processes of a homeowners' association. It also serves as a vital communication bridge between HOA officers and residents, promoting transparency and making the management of residential communities more efficient.

Automation of Residents' Records and Financial Transaction of ABS Homeowners Association Inc.

According to Ulidan (2020), this study focuses on automating the management of resident records and financial transactions in ABC Homeowners Association Inc., a non-profit organization in Parañaque City. It highlights problems with manual processes, such as mistakes in record-keeping and delays in generating financial reports, which hinder effective community management.

The study introduces an automated system designed to streamline the recording of homeowner information and the handling of financial transactions. Utilizing the Technology Acceptance Model (TAM) and Lewin's Change Management Model, the research also explores strategies to support HOA officers in adapting to the new system, emphasizing the importance of basic technological skills and the long-term sustainability of the system use.

On one hand, adopting an automated system enables homeowners' association to operate more efficiently, lessen errors, and improve financial transparency. The study highlights the value of using digital solutions in modernizing HOA operations, making operations smoother and provide better service to the residents.

Digital Payment Transformation in the Philippines: From Cash to GCash

According to Susilo and Dizon (2023), this study examines the shift in the Philippines from cash-based transactions to digital payment platforms such as GCash. The transition is attributed to factors including the increasing use of smartphones, government support, and the need for safer, contactless transactions during the COVID-19 pandemic. The study also discusses problems such as cybersecurity risks, regulatory issues, and the digital divide that make full adoption difficult.

This study contributes to the growing body of research about financial technology adoption, highlighting the need for stronger internet network, educating users about digital payment methods, and effective policy-making to ensure secure digital transactions. Online payment platforms like GCash made financial services more accessible, making transactions more convenient for individuals in both urban and remote areas. By understanding the advantages of digital payment system, more individuals and businesses can be encouraged to adopt transactions, thereby promoting financial inclusion and improving the speed, security, and convenience of daily transactions.

Effects of E-Payment in Billing and Collection Efficiency in Camella Ellisande: An Assessment

According to Balasabas, Binegas, Dela Cerna, Sumagaysay, and Valle (2022), the main goal of the study is to examine how the use of e-payment methods influences the billing and collection efficiency of association dues in Camella Ellisande. The researchers compared traditional cash payments with digital payment options to understand how these methods affect convenience and timeliness for homeowners.

Balasabas et al. explained that many homeowner's associations experience problems with manual collection, such as slow payment processing, late submissions, and difficulty in keeping accurate financial records. Their study found that digital payment methods offer faster and more organized transactions, which help reduce errors and delays in the billing and collection process.

The study concluded that e-payment systems contribute to better collection performance and improved communication between residents and administrators. It also emphasized that digital payments provide a practical and reliable option, especially in times when physical interaction is limited. These results show that digital payment integration can support a more efficient and accessible collection system for homeowner's associations.

From Surge to Stability Payments Driving a Steady Transition (BSP, 2024 Report on E-Payments Measurement)

According to the Bangko Sentral ng Pilipinas (2024), the purpose of the report is to present the progress and increasing adoption of digital payments in the Philippines. The report highlights that a large number of Filipinos now rely on digital channels for daily financial transactions, including personal transfers, merchant payments, and bill settlements.

The BSP report explained that the rise in digital payments is influenced by several factors such as convenience, the growing availability of e-wallets, and better access to mobile devices and internet services. The report also noted that many people prefer digital transactions because they allow faster processing and easier tracking of payments compared to cash.

The findings of the report show that digital payments are becoming a normal and trusted part of financial activities in the country. This steady growth indicates that organizations, including homeowner's associations, can benefit from offering digital payment options to their members. With more Filipinos becoming comfortable with digital transactions, e-payment systems have the potential to improve payment compliance and overall financial management.

FOREIGN LITERATURE

Automating Billing Systems for Enhanced Efficiency and Sustainability

Switching from paper-based billing processes to an automated billing system can significantly improve financial management; it will result in increased process efficiency and more accurate and reliable results (Pandey, Shukla, Singh, and Deepak, 2024). The research emphasizes the importance of transitioning to automated billing to streamline financial management processes and transactions and lower human errors.

According to this study, adopting automated billing systems benefits any type of organization and business. The system provides updates and notifications, user registration and authentication, automated billing, and integration of online payment. The system will streamline the overall work for businesses, specifically improving the accuracy of financial management, speeding up transactions, and keeping records organized. The study also emphasizes the importance of system scalability and user adoption and makes sure it can expand to meet the evolving needs of a company or organization.

The Role of the Village Government Performance and Transparency in Influencing Village Public Trust

According to Husni et al. (2023), this study reviews the role of the village government performance in gaining public trust by doing and promoting good governance, clear communication, and transparency. The study highlights that when an organization implemented transparent governance and honesty, the people would start to trust, contribute, and support the officials.

This research shows that having an open and organized village government, the public trust builds naturally. This emphasizes strengthening the connection between the village government and its residents by sharing and explaining to your people the government projects and decisions; they will feel included and respected. This study proves it with real data on how transparency did magic by how it glues everyone together.

What Drives Digital Payment Adoption? Examining the Role of Ease of Use, Security, and Trust

According to Fakriah et al. (2025), the study reviews the main factors that influence people to use digital payments, focusing on ease of use, security, and trust. The findings of this study show that users are more likely to switch to digital payments when the platform is easy to use, offers strong security, and builds trust. Understanding these factors can help businesses and financial institutions improve their digital payment systems to encourage more people to adopt them.

A simple and user-friendly design, reliable security measures, and trust-building efforts play a big role in making digital payments more acceptable to users. This study assesses how these factors influence users' behavior and encourage them to adopt digital payments instead of sticking to cash-based payments. By implementing the said factors, such as improving system design, strengthening security measures, and fostering user trust, we will definitely boost users' confidence in digital payments. These improvements can help create a more inclusive and user-friendly digital payment experience that is also secure and accessible to more people.

Investigating the Application of Digital Tools for Information Management in Financial Control: Evidence from Bulgaria

According to Zhelev and Kostova (2023), using digital tools is essential for better financial management because they help improve accuracy, efficiency, and decision-making. This study explains how digital solutions make financial processes smoother, ensuring transparency and reliability. However, issues such as data security risks, lack of digital skills, and difficulties in merging new systems with existing ones can slow down full adoption.

The study emphasizes the importance of applying digital tools to improve financial oversight. Embracing this solution and addressing these challenges, organizations can improve how they manage finances, increase work efficiency, and make better decisions. The organizations should invest in training programs for their people to learn tech skills and strengthen security practices. A well-applied use of digital tools fosters a safer, more transparent, and more streamlined financial management process.

A Systematic Literature Review of Factors Impacting the Adoption of an E-Payment System

According to Parmar and Machhar (2024), the adoption of e-payment systems is influenced by factors such as user-friendly design, efficiency, and usefulness. The said factors greatly encourage users to adopt e-payment systems rather than sticking to cash payments. The study highlights how e-payment systems simplify transactions, enhance efficiency, and improve user experience by ensuring smooth and secure digital interactions.

The research emphasizes the importance of strengthening cybersecurity measures, increasing user awareness about the correct use of digital payment, and ensuring system reliability to properly utilize the benefits of adopting an e-payment system. Additionally, if an organization implements these factors, it will result in efficient financial transactions, improve digital financial management, and enhance user experience in digital payment systems.

Financial Transparency, Trust, and Willingness to Pay in Local Governments of Sub-Saharan Africa

According to Krah and Mertens (2023), the study investigates how financial transparency in local governments affects citizen trust and their willingness to pay taxes and fees. The researchers surveyed residents from selected Municipal and Metropolitan local government units in Ghana to understand how access to clear financial information influences public behavior and perception. The study highlights the importance of showing citizens how public funds are collected, managed, and used to support community projects and services.

Krah and Mertens also identified several challenges faced by local governments, such as limited transparency, weak communication of financial reports, and low public trust. Their findings show that when citizens clearly see how their payments are handled, their trust increases, which leads to a higher willingness to pay taxes and community fees. The study confirms that improving financial transparency encourages cooperation between local governments and the public.

The study demonstrates the value of transparent systems in building trust and accountability. It explains that when financial records, spending reports, and project updates are easy to access and understand, people become more willing to comply with payments because they feel assured that their money is being used properly. These insights support the importance of developing systems that make financial information visible and understandable to the community.

Improving Operational Efficiency with an Automated Invoicing System

According to Milosheski and Karadimce (2025), the study focuses on how an automated invoicing system can improve the operational efficiency of a global Employer of Record company. Before automation, the company relied on manual processing that took several minutes per invoice and was vulnerable to human errors. The automated system was introduced to streamline tasks such as retrieving client information, calculating payroll, and generating invoices.

Milosheski and Karadimce also addressed common issues in manual financial processes, including slow processing times, inconsistent accuracy, and delays in releasing invoices. Their findings show that the automated system greatly reduced processing time, improved accuracy, and supported faster delivery of invoices to clients. As a result, the company was able to improve customer satisfaction and maintain a more reliable workflow.

The study emphasizes that automated financial processes help organizations reduce workload, improve productivity, and minimize errors. It also highlights that automation allows employees to focus on more important tasks rather than repetitive administrative work. This shows how digital financial tools contribute to more organized operations and support better financial management in organizations.

SYNTHESIS

The significance of adopting digital tools and automated systems to enhance work efficiency, improve financial transparency, lessen human errors, and simplify financial management of homeowners' association (HOAs) and other type of organizations is highlighted in this overview literature. The studies emphasize the need for digital solutions to resolve common issues such as delayed payments, manual payment process, paper-based receipts, poor financial management and ineffective record-keeping.

Moreover, research by Alvara, Amante, and Paurom (2023) and Florendo (2021) highlights how management systems with digital features, such as email notifications and online payment platforms like GCash, improve communication, enhance financial transparency, and streamline transactions in homeowners' associations. Additionally, Dela Cruz and Santiago (2022) also emphasize the importance of automated financial tracking in reducing human errors and ensuring accountability in community organizations. Their study shows that digital record-keeping not only simplifies financial management but also strengthens trust among members by providing clear and accessible transaction histories.

Transitioning to automated billing systems enhances efficiency, accuracy, and overall financial stability, similar to the benefits observed in HOAs (Pandey et al. 2024). These findings align with research emphasizing the role of digital tools in improving financial management and building trust in organizations. Additionally, Fakriah et al. (2025) and Parmar and Machhar (2024) suggest that user-friendly design, strong security guidelines, and methods to strengthen trust are important when encouraging users to adopt digital payment systems. As time goes by the technology keeps on evolving, these digital tools will continue to enhance financial processes, making payment transactions more secure, efficient, and accessible.

RESEARCH FRAMEWORKS

THEORETICAL FRAMEWORK

Fred Davis in 1989 created a theory called the Technology Acceptance Model (TAM); it provides explanations about how people decide to use new technology. Davis believed that two main things affect someone's decision whether to adopt and use a system: how useful they think it is and how easy it is to use. "Perceived Usefulness" means people believe the technology can make their work easier, like helping them save time or effort. "Perceived Ease of Use" means they think the system won't be difficult to learn or work with. TAM says that if people see a system as helpful and simple, they are more likely to use it. Davis also showed that these feelings shape their attitude toward the technology, which then affects how much they actually use it.

Technology Acceptance Model (TAM) provides useful insights for developing an automated homeowners' association fee collection and budget transparency system. In this study, highlights the significance of creating a system that both homeowners and HOA administrators will find it useful and easy to use. For homeowners, the study emphasizes the need for a system that simplifies payment processes and provides updates into how their money is managed. For administrators, it focuses on streamlining tasks such as tracking payments and sharing updates to make their work more efficient and less stressful. TAM focuses on designing a system that meets users' needs to encourage people use it regularly.

By implementing Davis' ideas, homeowners and administrators can create a system that is efficient, accurate, more secure, and user-friendly. It helps homeowners feel more in control of their payments and finances while making the administrator's work easier. A well- designed system also reduces errors and improves communication, making the whole process smoother for everyone.

CONCEPTUAL FRAMEWORK

Figure No.1 Conceptual Framework of HOAConnect: An Automated Homeowner's Association Fee Collection and Budget Transparency System

The ISO Model's (Figure 1) shows the conceptual framework of HOAConnect: An Automated Homeowners' Association Fee Collection and Budget Transparency System for Mabuhay Homes 2000 consisting of four blocks: input, process, output, and evaluation. Input outline three types of requirements: knowledge, software, and hardware. Knowledge requirements include skills such as programming, database management, UI design, and computer literacy. Software requirements include technologies like HTML, Tailwind CSS, PHP, JavaScript, MySQL, Apache, Visual Studio Code, PHP Extension, Git, Font Awesome UI, Calendar.js, AJAX, and DomPDF. The hardware requirements consist of a Gigabyte motherboard, an AMD Ryzen 5 5600x processor, DDR4 Fury 2x8GB RAM, an Nvidia GeForce RTX 4060 GPU, SSD M.2 NVME 1TB storage, and a Corsair CV650 Watts PSU.

The process involves three stages: Data Gathering and Research, System Design, and Maintenance. Data Gathering and Research focus on data collection, analysis, and research to support system development. System Design includes creating a wireframe, ERD (Entity-Relationship Diagram), and flowchart to structure the system's architecture. Maintenance ensures system improvement and updates after implementation.

The Output refers to the final product of the project. The project aims to develop a web-based system called "HOAConnect," an automated Homeowners' Association fee collection and budget transparency system for Mabuhay Homes 2000, Barangay Paliparan II, Dasmariñas City, Cavite. This system is designed to streamline workflows, processes, transactions, and user-friendly tool that will benefit both HOA officers and homeowners.

Lastly, the evaluation block which encompasses ISO 25010 will be used to evaluate the HOAConnect to ensure quality. The eight characteristics of ISO 25010 will serve as the basis for evaluation, the list includes functional stability, performance efficiency, compatibility, usability, reliability, security, maintainability, and portability.

SYSTEM FLOWCHART

Figure No.2 Flowchart for President User of HOAConnect

Figure No.6 Flowchart for Auditor User of HOAConnect

Figure No.7 Flowchart for Homeowners User of HOAConnect

RESOURCES

The document indicates the hardware and software requirements for the HOAConnect project. The hardware section outlines the recommended computer components to maintain the system in good working condition. The software tools and applications section outlines the tools required for development and deployment of the HOAConnect.

SOFTWARE REQUIREMENTS

To guarantee the success development and deployment of “HOAConnect”, a variety of software tools and applications will be utilized. Below is the detailed description of each to and how it contributes to the project:

- **HTML:** A language that assists in creating and structuring content on websites, including text, images, and links.
- **Tailwind CSS:** Is a collection of ready-made styles that you can use to rapidly style and change the appearance of a website.
- **PHP:** A programming language used to build websites that can change or update based on the users' actions.
- **JavaScript:** A programming language that makes websites interactive. It adds features like buttons and animations.
- **MySQL:** A database system for storing and managing data. It is like an digital filing cabinet for websites.
- **Apache:** A computer software that is executed on a computer to deliver websites to individuals on the internet.
- **PHP Extension:** Other tools or features you can add to PHP so that it can do more.
- **Git:** A tool that assists in keeping track of changes in code and allows multiple developers to work on it simultaneously.

- **Visual Studio Code:** Visual Studio Code is a source-code editor utilized by developers due to its features like debugging, code completion, and other tools that support the development process.
- **Font Awesome UI:** A toolkit used for adding icons and improving the user interface, making navigation and features visually appealing.
- **Calendar.js:** A JavaScript library used to manage and display dates, schedules, and events dynamically within the system.
- **DomPDF:** A PHP library used to generate and export PDF files, like reports, directly from the system interface.
- **AJAX (Asynchronous JavaScript and XML):** A web development technique used to send and receive data from the server without reloading the entire page. In **HOACconnect**, it is specifically utilized to handle notifications, allowing the system to display alerts and updates efficiently while maintaining a smooth user experience.

HARDWARE REQUIREMENT

These hardware requirements are tailored to support the performance and needs of “HOACConnect”, the hardware specifications listed below are suggested:

- Motherboard: Gigabyte
- CPU: AMD Ryzen 5 5600x
- RAM: DDR4 Fury 2x8GB
- GPU: Nvidia GeForce RTX 4060
- Storage: SSD M.2 NVME - 1TB
- PSU: Corsair CV650 Watts

CHAPTER III RESEARCH METHODOLOGY

This section of the research study presents the methodologies used, the techniques used in data collection, and steps taken to develop HOAConnect. It also discusses the procedures undertaken to ensure the research progressed in an orderly and structured manner.

RESEARCH METHOD USED

In this study, the developers will implement developmental and descriptive design to create and validate HOAConnect: An Automated Homeowners' Association Fee Collection and Budget Transparency System for Mabuhay Homes 2000 in Barangay Paliparan II, Dasmariñas City, Cavite. A mixed method approach will be applied for the research method, combining interviews and surveys. Interviews with homeowners and HOA administrators will help gather their needs and opinions, while surveys will measure their satisfaction and feedback on the system's features using rating scales.

For the developmental design, the developers will follow a modified waterfall model under the Software Development Life Cycle (SDLC). The Modified Waterfall Method follows a structured sequence of development steps, while allowing some flexible repetitions. This approach helps ensure proper documentation and thorough design reviews, which contribute to the quality, reliability, and maintainability of the custom software being developed.

Figure No.8 Modified Waterfall Method

Phase 1: Requirements Analysis

In the first phase, the researchers exchanged insights, planned, and gathered suggestions. Tasks and roles were also assigned to each member to maintain an organized workflow. Consultations with the HOA officers were done during this phase, where they provided relevant information, insights, and recommendations for the system. All collected data were documented, and the researchers ensured that the requirements from the HOA officers were clear and complete.

Phase 2: System Design

In the second phase it focuses on designing the HOAConnect structure, data flow, and user interface (UI) mock-ups in accordance to the information and requirements that have been collected. This stage involves reviewing and studying the previous phase and developing the system design.

Phase 3: Implementing

In this phase the researchers utilized various software, such as Apache, PHP, JavaScript, MySQL, PHP Extension, Git, Font Awesome UI, Calendar.js, DomPDF, AJAX, and Visual Studio Code to develop HOAConnect: An Automated Homeowners' Association Fee Collection and Budget Transparency System.

Phase 4: Testing

This phase focuses on testing the system before the deployment of the developed HOAConnect: An Automated Homeowners' Association Fee Collection and Budget Transparency System. It is set to undergo thorough testing to assess its security, performance, and functionality. This stage ensures that the system meets its objectives, detects bugs or issues, and ensures that it is ready and suitable for users. Any problems that may be found during testing are addressed before deployment to ensure the system meets the requirements.

Phase 5: Deployment

In the fifth phase is where the final refinements to the HOAConnect system will be made. The main goal of this stage is to deploy HOAConnect: An Automated Homeowners' Association Fee Collection and Budget Transparency System for Mabuhay Homes 2000, Barangay Paliparan II, Dasmariñas City, Cavite, into the live environment so that users can begin using it. Once both functional and non-functional pilot tests are completed, the fully operational system is officially released or handed over to the client.

Phase 6: Maintenance

During this phase, regular updates and enhancements are carried out. Any bugs that appear after the system is launched need to be addressed, performance must be monitored and optimized, and security patches should be applied to keep the system secure. Additionally, new features may be introduced based on user feedback. In this stage maintenance ensures that the HOAConnect: An Automated Homeowners' Association Fee Collection and Budget Transparency system remains reliable, secure, and adaptable to evolving needs over time.

Philippine Christian University

College of Informatics

POPULATION FRAME AND SAMPLING SCHEME

This study used the non-probability sampling approach known as the purposive sampling method to identify participants within the study's population frame. This study's population frame consists of one hundred (100) homeowners who reside in Mabuhay Homes 2000, Barangay Paliparan II, Dasmariñas City, Cavite. In addition, the researchers selected three (3) IT practitioners with at least three years of experience and relevant expertise to suitably evaluate HOAConnect: An Automated Homeowners' Association Fee Collection and Budget Transparency System. Furthermore, the researchers selected five (5) key personnel from HOA office of Mabuhay Homes 2000, the president, admin, treasurer, auditor, and secretary, they serve as system administrators as they are responsible for fee collection and document record keeping within the association.

DESCRIPTION OF THE RESPONDENTS

- **System Administrators:** The president, admin, secretary, treasurer, and auditor of the HOA officers serve as the system administrators. They are responsible for handling administrative tasks such as monitoring fee collection, managing the system, and overseeing user information.
- **IT Professionals:** Individuals who graduated a bachelor's degree in Computer Science, Information Technology, or Computer Engineering and have three or more years of professional experience in areas such as web development, database management, or system security. They are responsible for evaluating the system's technical aspects to ensure it performs well and handles data securely.
- **Homeowners:** These are homeowners and residents of Mabuhay Homes 2000 subdivision in Barangay Paliparan II, Dasmariñas City, Cavite. They will use HOAConnect to pay monthly dues, access budget transparency updates, receive notifications about payment, and community events.

RESEARCH INSTRUMENT USED

Figure 9. ISO 25010:2011

The researchers will use the standard questionnaire set by the ISO 25010:2011 standard, formally known as Systems and Software Engineering – Systems and Software Quality Requirements and Evaluation (SQuaRE) – System and Software Quality Models. This quality model outlines eight main characteristics: functional stability, efficiency/performance, compatibility, usability, reliability, security, maintainability, and portability. Each of these is further divided into sub-characteristics, which address both the static attributes of the software and the dynamic behavior of the computer system.

The questionnaire will consist of two sections. The first section will collect the respondent's personal information. The second section will assess the web system based on the evaluation criteria defined by the ISO 25010 standard. The survey can be responded to using a Likert scale with five-response options in which five (5) is the highest and one (1) is the lowest with the following interpretations.

Verbal Interpretation	Value	Range
Very Effective	5	4.50 - 5.00
Effective	4	3.50 - 4.49
Moderately Effective	3	2.50 - 3.49
Somewhat Effective	2	1.50 - 2.49
Not at All Effective	1	1.00 - 1.49

Table 1. Likert Scale

The researchers will use ISO 25010:2011 as the standard for evaluating the system "HOACConnect". ISO 25010:2011 is a quality model comprising eight characteristics:

- **Functional Suitability:** The degree to which a system or software provides functions that meet stated and implied needs when used under specified conditions.
- **Performance Efficiency:** The degree to which a system or software performs its functions within specified time and throughout parameters and efficiently uses resources under specified conditions.

Philippine Christian University

College of Informatics

- **Compatibility:** The degree to which a system or software can exchange information with other products and systems or perform its required functions while sharing the same common environment and resources.
- **Usability:** This refers to how easy and efficient it is for specific users to accomplish their goals using a system or software, while also feeling satisfied with the experience.
- **Reliability** - The degree to which a system or software to consistently perform its intended functions under defined conditions over a given period of time.
- **Security:** The degree to which the ability of a system or software to safeguard information and data by preventing unauthorized access or changes, while ensuring access for authorized users.
- **Maintainability:** The degree of how easily and efficiently a system or software can be updated, whether to fix issues, make improvements, or adapt to changes in its environment.
- **Portability:** The degree to which a product can be adapted to changes in its requirements, contexts of use, or system environment.

DATA GATHERING PROCEDURE

A Focus Group Discussion (FGD) was conducted as a qualitative research approach to gather insights from selected homeowners and HOA administrators of Mabuhay Homes 2000. The discussion focused on identifying current processes, challenges, and preferred system features. Its purpose was to capture the experiences, needs, and recommendations of stakeholders. Prior to conducting the FGD, the researchers formally requested permission from the HOA officers.

The data gathering process was divided into three stages. First, the researchers identified qualified respondents and sent a formal request letter to the HOA office to secure permission to conduct the survey inside Mabuhay Homes 2000 subdivision. Second, another request letter was submitted to the HOA office to obtain approval for the system demonstration and evaluation. Lastly, the researchers collected all survey responses and analyzed them. Since the survey utilized Likert-type scales, the responses were evaluated using quantitative methods, specifically by assigning numerical values to the items and computing statistical measures such as the mean and standard deviation.

STATISTICAL TREATMENT OF DATA

To better understand and interpret the data collected during the research, the researchers will use the Mean to summarize and describe how the responses are distributed. This will help highlight the typical or most representative values related to different aspects of the system. In addition, the Standard Deviation will be used to assess how much the responses vary, giving insight into the consistency or spread of the data.

Mean

$$\bar{x} = \frac{\sum x}{n}$$

$\bar{x}$ = sample mean

n = number of values in the populations

$\sum x$ = sum of each value in the sample

Standard Deviation

$$s = \sqrt{1/n - 1 \sum (X_i - \bar{x})^2}$$

s = Population Standard Deviation

X_i = individual values in sample

$\bar{x}$ = sample mean

n = number of values in sample

Slovin's Formula

To obtain a representative sample of respondents for surveying their needs and preferences regarding the system, Slovin's formula will be used to determine the minimum sample size.

Slovin's formula is calculated as:

$$n = N / (1 + Ne^2)$$

where:

n = sample size

N = population size

e = acceptable margin of error

CALENDAR OF ACTIVITIES

The researchers carried out various activities to initiate the proposed project. The researchers engaged in project planning to brainstorm ideas and finalize the thesis topic. This process helped the researchers to gather and prioritize potential concepts for the study. During the thesis title proposal, three research titles were proposed and discussed to narrow the focus down to a single topic. The panel approved the title "HOAConnect: An Automated Homeowners' Association Fee Collection and Budget Transparency System for Mabuhay Homes 2000, Barangay Paliparan II, Dasmariñas City, Cavite". Afterward, the researchers concentrated on writing the thesis chapters and gathering the necessary data. The design stage then played a vital role in shaping the project by identifying essential components, modules, and interfaces. Through flowcharts and interface prototypes, the researchers were able to visualize user interactions and ensure that the proposed system would be both functional and user-friendly.

The researchers concentrated on transforming their plans into a working system. This phase involved refining the system design and beginning the implementation stage, where the features of HOAConnect were coded and integrated based on the planned specifications. The researchers also developed and standardized the database, followed by designing an intuitive interface that would make the system easy to navigate. Once the main functionalities were completed, thorough testing was conducted to detect and resolve potential issues, ensuring that the system met the users' needs effectively. Finally, the deployment phase was carried out, which involved preparing the system for presentation and potential real-world application, as well as finalizing materials for the thesis defense.

CHAPTER IV PRESENTATION OF DATA

This chapter presents the materials and methods used to conduct the study. It includes the requirement analysis, requirement documentation, and the design of the software and its processes. The purpose of the study is to develop a system that improves the efficiency and transparency of fee collection and financial management for the homeowners' association. It also aims to understand the users' experiences and expectations to ensure the system is user-friendly and responsive to their needs. By focusing on these aspects, the research ensures that HOAConnect is both technically effective and practical for real-world application.

PROJECT REQUIREMENTS

Functional Requirements

Functional requirements specify what the system must accomplish to meet the needs of the users and deliver the expected services. The PCU-DASMA CONNECT system includes four (4) primary user roles: Admin, Staff, Alumni, and Partner. Each role provides distinct functions and access privileges based on the user's responsibilities.

Admin Side

Dashboard Module

Functional requirements specify what a system or project is supposed to accomplish to meet user needs and ensure the desired functionality.

President Side

- **Login Module:** Enables the president to securely log in to the system.
- **Dashboard Module:** Displays a summary of key data, including total collected fees, total number of registered users, and total events.
- **Admin Management Module:** Provides control over administrative account information's, including adding, updating, and deactivating admin users.
- **Reports Overview Module:** Presents a summary of total collections, total users, and ongoing projects to monitor the HOA's financial status and activities.
- **Fee Approval Module:** Allows the president to review and approve fee types created by the admin before they are implemented in the system.
- **Project and Budget Resolution Approval Module:** Allows the president to review, approve, or reject project resolutions submitted by the secretary before they are carried out in the system.
- **Liquidation of Expenses Module:** Allows the president to review, approve, or reject expense liquidation reports submitted by the auditor.

Admin Side

- **Dashboard Module:** Display notifications, updates and statistics regarding available jobs, events, and partnership opportunities.
- **Dashboard Module:** Displays a summary of key data, including total collected fees, total number of registered users, and total events.
- **Account Management Module:** Allows the creation, updating, and deactivation of homeowner accounts.
- **Payment Verification Module:** Enables the admin to verify payments submitted by homeowners.

- **Announcements and Posts Module:** Enables the posting of updates, community announcements, and project information.
- **Walk-in Payment Recording Module:** Records cash payments made offline to ensure complete and accurate transaction tracking.
- **Amenities Management Module:** Records all available HOA amenities and tracks payments made for their usage or rental within the system.
- **Remittance Request Module:** Allows the admin to create and submit daily remittance requests for collected payments, which are sent to the treasurer for review and confirmation.
- **Payment History Module:** Displays updates on the payment transaction history of homeowners and amenities.

Secretary Side

- **Login Module:** Allows the secretary to securely log in using system-provided credentials to access their account.
- **Dashboard Module:** Displays a summary of key data, including total collected fees, total number of registered users, and total events.
- **Project Resolution Management Module:** Enables the secretary to create and manage project resolutions that require the president's review and approval.
- **Announcements Module:** Allows the secretary to post updates about upcoming events and other community-related news.
- **Posts Module:** Enables the secretary to upload and publish documentation of completed projects.

Treasurer Side

- **Login Module:** Enables the treasurer to securely log in using system-provided credentials to access their account.
- **Dashboard Module:** Displays a summary of key data, including total collected fees, total number of registered users, and total events.
- **Fund Release Module:** Allows the treasurer to record and update the release of funds allocated for HOA projects.
- **Payment History Module:** Displays updates on the payment transaction history of homeowners and amenities.
- **Remittance Approval Module:** Enables the treasurer to review and approve remittance requests submitted by the admin once the funds have been successfully received.

Auditor Side

- **Login Module:** Enables the auditor to securely log in using system-provided credentials to access their account.
- **Dashboard Module:** Displays a summary of key data, including total collected fees, total number of registered users, and total events.
- **Liquidation of Expenses Module:** Allows the auditor to prepare and submit expense liquidation reports for HOA projects and expenditures, subject to the president's review and approval.
- **Financial Audit Module:** Provides a comprehensive view of all financial activities to ensure transparency, accountability, and accuracy of records.

Homeowners Side

- **Login Module:** Enables homeowners to securely log in using credentials provided by the admin to access their accounts.
- **Dashboard Module:** Displays a summary of key data, including total collected fees and total events.
- **Online Payment Module:** Allows homeowners to pay monthly dues and amenity fees through digital payment methods such as GCash or bank transfer.
- **Proof of Payment Upload Module:** Enables homeowners to upload payment receipt images for verification.
- **Payment Status Module:** Displays updates on payment status and any outstanding balances.
- **Payment History Module:** Displays a detailed record of all past transactions.
- **Budget Transparency Module:** Provides homeowners access to the project details, and expense reports for financial transparency.
- **Notification Module:** Receive email notifications for payment reminders and updates.

Non-Functional Requirements

The requirements to assess the quality of operations rather than specific functionality in the system are known as non-functional requirements. Some of the system's non-functional requirements include:

- The system should ensure that pages such as the dashboard and payment module load quickly to provide a smooth and responsive experience for all users, including homeowners and administrators.
- Each user role, including the President, Admin, Secretary, Treasurer, Auditor, and Homeowner, should have access only to modules and data specific to their assigned role to maintain confidentiality and data protection.
- The user interface should be intuitive and user-friendly, minimizing the number of clicks or steps required for tasks such as paying dues, verifying payments, or viewing project reports.
- The system should be compatible with commonly used web browsers such as Google Chrome, Microsoft Edge, and Safari. It should also be optimized for mobile devices to allow convenient access for users anywhere.
- HOAConnect should perform consistently under normal usage conditions, ensuring that all functions work correctly without failure.
- The system should be developed with modular and organized code to simplify updates, debugging, and integration of new features or security enhancements in the future.

DATA FLOW DIAGRAM

Data Flow Diagram explains the flow of data in the application and what is needed before data is processed.

ENTITY RELATIONSHIP DIAGRAM

SUMMARY

This capstone project, titled ***HOAConnect: An Automated Homeowners' Association Fee Collection and Budget Transparency System for Mabuhay Homes 2000, Barangay Paliparan II, Dasmariñas City, Cavite***, aims to streamline the collection of monthly dues and amenities fee, enhance record-keeping, and promote transparency in financial management for the Mabuhay Homes 2000 Homeowners' Association. A survey was conducted involving one hundred eight (108) respondents, including three (3) IT experts, the administrators of the Homeowners' Association, which consist of one (1) president, one (1) secretary, one (1) treasurer, one (1) auditor, one (1) admin, and one hundred (100) homeowners from Mabuhay Homes 2000 subdivision. Data collection was facilitated through Google Forms, utilizing questions aligned with the ISO 25010:2011 evaluation criteria. Responses were measured using a Likert scale, complemented by qualitative feedback through open-ended questions.

RESULT AND DISCUSSION

INDICATOR	MEAN	STANDARD DEVIATION	REMARKS
FUNCTIONAL STABILITY			
How effective is the software in meeting your needs?	4.96	0.19	Very Effective
How effective are the results provided by the software in meeting your expectations?	4.98	0.14	Very Effective
How effectively does the software adhere to rules and regulations?	4.40	0.67	Effective
Composite Mean:	4.78	0.33	Very Effective

Table 2. The result of the Functional Suitability

The results presented in Table 2 affirm the web system's exceptional functional stability, with a Composite Mean of 4.78 (SD = 0.33) and an overall rating of very effective. Users rated the system highest in providing results that meet their expectations (Mean = 4.98, SD = 0.14), followed very closely by its effectiveness in meeting their needs (Mean = 4.96, SD = 0.19), both indicators receiving near-perfect scores and reflecting extraordinary user satisfaction. The system's adherence to rules and regulations, while still rated positively, obtained a comparatively lower mean of 4.40 (SD = 0.67) and was interpreted as effective.

Standard deviation values across the three indicators are notably low, ranging from 0.14 to 0.67, demonstrating remarkable consistency in user perceptions. The extremely low SD of 0.14 for the item concerning the effectiveness of results in meeting expectations indicates almost unanimous agreement among respondents. Similarly, the SD of 0.19 for meeting user needs reflects very strong consensus. The higher SD of 0.67 for adherence to rules and regulations suggests slightly greater variation in opinion, possibly due to differing levels of familiarity with relevant standards or regulatory requirements.

In summary, the Composite Mean of 4.78 strongly confirms that the system excels in functional stability and consistently delivers outcomes that align with or exceed user expectations. The exceptionally low variability in responses further reinforces the uniformity of positive user experience. Minor refinement in ensuring clearer demonstration or perception of regulatory compliance could elevate this already outstanding dimension to even greater uniformity and satisfaction.

INDICATOR	MEAN	STANDARD DEVIATION	REMARKS
PERFORMANCE EFFICIENCY			
How effective is the system in providing prompt responses?	4.73	0.57	Very Effective
How effectively does the system utilize its resources?	4.60	0.69	Very Effective
How effective is the system in managing large amounts of information?	4.60	0.57	Very Effective
Composite Mean:	4.64	0.61	Very Effective

Table 3. The result of the Performance Efficiency

The results presented in Table 3 confirm the web system's strong performance efficiency, with a Composite Mean of 4.64 (SD = 0.61) and an overall rating of very effective. Users rated the system most highly for providing prompt responses (Mean = 4.73, SD = 0.57), followed closely by its effectiveness in managing large amounts of information and in utilizing resources efficiently (both Mean = 4.60, SD = 0.57 and 0.69, respectively). All three indicators received very effective remarks, reflecting excellent user satisfaction with speed, scalability, and resource management.

Standard deviation values are consistently low, ranging from 0.57 to 0.69, which indicates strong agreement among respondents. The identical SD of 0.57 for both prompt responses and handling large volumes of data demonstrates particularly high consensus on these critical aspects of performance. The slightly higher SD of 0.69 for resource utilization, while still low, suggests marginally greater variation in perception possibly due to differences in user workloads or device environments.

In summary, the Composite Mean of 4.64 solidly affirms that users perceive the system as fast, scalable, and resource-efficient. The uniformly low variability in responses further reinforces the consistency of this positive experience. Minor optimizations in response latency and resource usage under varying conditions could push an already outstanding performance profile even closer to perfection, ensuring continued high satisfaction across all usage scenarios.

INDICATOR	MEAN	STANDARD DEVIATION	REMARKS
USABILITY			
How effective is the system in accurately recognizing the information you input?	4.54	0.63	Very Effective
How effective is the system in terms of ease of learning and usability?	4.47	0.66	Effective
How effective is the system in minimizing the effort required to use it?	4.42	0.80	Effective
How effective is the system in helping you prevent errors?	4.33	0.82	Effective
How effective is the interface in providing an appealing and user-friendly design?	4.50	0.66	Very Effective
How effective is the system in facilitating your understanding of its usage?	4.54	0.67	Very Effective
Composite Mean:	4.47	0.71	Effective

Table 4. The result of the Usability

The results presented in Table 4 confirm the web system's high usability. The Composite Mean score is 4.47 (SD = 0.71), which corresponds to an overall remark of effective. Users perceived the system as very effective in accurately recognizing the information they input (Mean = 4.54, SD = 0.63) and in facilitating understanding of its usage (Mean = 4.54, SD = 0.67). Another aspect rated as very effective was the appealing and user-friendly interface design (Mean = 4.50, SD = 0.66). The ease of learning and usability of the system also received a strong rating (Mean = 4.47, SD = 0.66).

The system's effectiveness in minimizing the effort required to use it was rated at 4.42 (SD = 0.80), while its effectiveness in helping users prevent errors obtained the lowest mean score of 4.33 (SD = 0.82). Despite being the lowest, this value still falls solidly within the effective range. The standard deviation values across all indicators range from 0.63 to 0.82, reflecting moderate consistency in respondents' perceptions. The lowest SD of 0.63, observed for accurate input recognition, indicates the highest level of agreement among users. In contrast, the highest SD of 0.82, associated with error prevention, reveals slightly greater variability in user opinions on this particular feature.

Overall, the Composite Mean of 4.47 strongly supports the system's efficiency and effectiveness. Nevertheless, the relatively lower mean of 4.33 coupled with the highest standard deviation for the error-prevention item suggests that this aspect represents a potential area for further improvement.

INDICATOR	MEAN	STANDARD DEVIATION	REMARKS
RELIABILITY			
How effective have the improvements been in addressing issues within the software over time?	4.47	0.63	Effective
How effective is the system in being available whenever you need it?	4.50	0.76	Very Effective
How effective is the software in managing errors?	4.32	0.91	Effective
How effective is the software in recovering lost information after an issue occurs?	4.25	0.89	Effective
Composite Mean:	4.39	0.80	Effective

Table 5. The result of the Reliability

The results presented in Table 5 confirm the web system's reliable performance, with an overall Composite Mean of 4.39 (SD = 0.80), corresponding to an effective rating. Users perceived the system as very effective in being available whenever needed (Mean = 4.50, SD = 0.76). This was the highest-rated indicator. Closely following was the effectiveness of improvements in addressing issues within the software over time (Mean = 4.47, SD = 0.63), reflecting strong user confidence in the system's continuous enhancement. The system's effectiveness in managing errors received a mean score of 4.32 (SD = 0.91), while its effectiveness in recovering lost information after an issue occurs obtained the lowest mean of 4.25 (SD = 0.89). Although both indicators still fall within the effective range, they represent the relatively weaker aspects of reliability.

Standard deviation values across the four indicators range from 0.63 to 0.91, indicating moderate to slightly higher variability in user perceptions. The lowest SD of 0.63, associated with the effectiveness of improvements in addressing issues, demonstrates the strongest consensus among respondents. In contrast, the highest SD of 0.91 for error management reflects the greatest diversity of opinions on this feature, followed closely by information recovery (SD = 0.89).

Overall, the Composite Mean of 4.39 solidly supports the system's reliability and operational resilience. Nevertheless, the comparatively lower means coupled with the highest standard deviations for error management and information recovery highlight these as priority areas for further improvement. Enhancing these specific capabilities would strengthen the system's dependability and further elevate user trust and satisfaction.

INDICATOR	MEAN	STANDARD DEVIATION	REMARKS
SECURITY			
How effective is the software in preventing unauthorized access?	4.25	0.87	Effective
How effective is the system in preventing unauthorized changes to your information?	4.28	0.82	Effective
How effective is the system in maintaining a record of user activities?	4.31	0.92	Effective
How effective are the overall security features of the system?	4.45	0.86	Effective
Composite Mean:	4.32	0.87	Effective

Table 6. The result of the Security

The results presented in Table 6 affirm the web system's strong security posture, as evidenced by a Composite Mean of 4.32 ($SD = 0.87$) and an overall rating of effective. Among the individual indicators, users rated the overall security features of the system most favorably (Mean = 4.45, $SD = 0.86$), followed by the system's effectiveness in maintaining a record of user activities (Mean = 4.31, $SD = 0.92$), preventing unauthorized changes to information (Mean = 4.28, $SD = 0.82$), and preventing unauthorized access (Mean = 4.25, $SD = 0.87$). All four indicators were evaluated as effective, reflecting solid user confidence across all measured dimensions of security.

Standard deviation values range from 0.82 to 0.92, indicating moderate consistency in respondents' perceptions. The lowest SD of 0.82, associated with preventing unauthorized changes to information, reflects the strongest consensus among users. The highest SD of 0.92, observed for maintaining a record of user activities, suggests slightly greater variability in user opinions regarding the visibility or usefulness of audit logs.

Overall, the Composite Mean of 4.32 clearly demonstrates that users perceive the system as secure and trustworthy. Nonetheless, the marginally higher variability in responses concerning the recording of user activities points to a potential area for refinement. Enhancing the clarity, accessibility, or perceived value of activity logs could further strengthen user confidence and elevate the already high level of satisfaction with the system's security capabilities.

INDICATOR	MEAN	STANDARD DEVIATION	REMARKS
FUNCTIONAL STABILITY	4.78	0.33	Very Effective
PERFORMANCE EFFICIENCY	4.64	0.61	Very Effective
USABILITY	4.47	0.71	Effective
RELIABILITY	4.39	0.80	Effective
SECURITY	4.37	0.87	Effective
Composite Mean:	4.53	0.66	VeryEffective

Table 7. The summary of the results

The results summarized in Table 7 clearly demonstrate the web system's excellent overall quality, achieving a Composite Mean of 4.53 (SD = 0.66) and an overall rating of very effective. Among the five evaluated dimensions, Functional Stability received the highest rating (Mean = 4.78, SD = 0.33), followed closely by Performance Efficiency (Mean = 4.64, SD = 0.61), both earning very effective remarks. Usability was rated at 4.47 (SD = 0.71), while Reliability and Security recorded means of 4.39 (SD = 0.80) and 4.37 (SD = 0.87) respectively, both interpreted as effective. These scores reflect strong user satisfaction across all measured attributes, with particular excellence in functional stability and performance efficiency.

Standard deviation values range from a remarkably low 0.33 for Functional Stability indicating exceptionally strong consensus to 0.87 for Security, still reflecting moderate consistency. The notably low SD of 0.33 for Functional Stability underscores nearly unanimous agreement on the system's dependability and correctness of operation, whereas the higher SDs in Reliability and Security suggest slightly greater variation in user experiences related to error management, recovery mechanisms, and certain security features.

In conclusion, the Composite Mean of 4.53 firmly establishes the system as highly effective and well-received by its users. The consistently high scores and relatively low variability across dimensions affirm that the system successfully meets user expectations in terms of functionality, speed, ease of use, dependability, and protection. Targeted improvements in the comparatively lower-scoring areas of error handling, data recovery, and specific security controls would further elevate an already outstanding evaluation, ensuring sustained user trust and satisfaction.

CONCLUSION

Based on the summary of findings, HOAConnect successfully satisfies the requirements of a web-based homeowner management system by achieving high effectiveness ratings in Functional Suitability, Performance Efficiency, Usability, Reliability, and Security. The system demonstrates strong functional stability, responsive performance, and secure features that collectively support the efficient management of homeowner records, payment processing, and community transparency. With an overall composite mean score of 4.53, HOAConnect effectively meets the users' needs and expectations by providing an intuitive and well-structured interface that promotes accessibility and ease of use.

Although the system performs effectively across all evaluation areas, further refinement can still be made to enhance Reliability, Security, and Usability. Improvements in aspects such as error handling, data recovery, and access control would strengthen the system's overall consistency and robustness. These enhancements would make the platform even more secure, responsive, and user-centered, ensuring a smoother experience for administrators and homeowners alike.

These findings highlight the importance of maintaining a balanced approach to system development within HOAConnect. As its core features continue to evolve and improve, the system's functionality and reliability will further strengthen, fostering greater confidence and participation among homeowners and association administrators. Overall, HOAConnect promotes more efficient and transparent operations, enabling streamlined management within homeowner communities and fulfilling its goal of advancing administrative efficiency, user engagement, and trust among the residents of Mabuhay Homes 2000.

RECOMMENDATIONS

Based on user feedback and survey results, future developers are encouraged to implement the following features to further enhance the overall quality and functionality of HOAConnect:

1. Implement an SMS notification feature to provide homeowners and administrators with faster updates on assigned fees, payment confirmations, announcements, and other important notices.
2. Optimize performance efficiency by improving system responsiveness and stability, particularly during periods of high user activity.
3. Include a guided onboarding or help section to assist new users in navigating and utilizing the system's features effectively.
4. Develop a Frequently Asked Questions (FAQ) section to provide users with quick access to solutions for common inquiries and concerns.

March 7, 2025

Benilda Mansat
Home Owners Association President
Mabuhay Homes 2000
Paliparan 2, Dasmariñas, Cavite

Dear Ms. Mansat:

First and foremost I would like to thank you for accommodating the following students;

- Castillo, Mark John S.
- Copon, Raemel Gerard M.
- Rodriguez, Gio Iverson A.
- San Jose, Marj Celine A.

They are currently taking up Capstone Project and Research for this First Semester, School Year 2024-2025 and part of the requirement of the course is the submission of project documentation and the actual development of the proposed system.

They have expressed their willingness to develop a system for your office entitled "HOACONNECT: AN AUTOMATED HOMEOWNERS' ASSOCIATION FEE COLLECTION AND BUDGET TRANSPARENCY SYSTEM FOR MABUHAY HOMES 2000". In this regard, may I request for your approval in allowing our students to make an understudy of the current process of your office related to the proposed system. May I also request to please grant these students for interviews and other sources of significant information so that they have an overview of the operations, managements, and needs of your department which would be used as basis for the development of the proposed system.

Our department will greatly appreciate your approval and any help you can extend to them.

More power and God bless!

Sincerely yours,

JASON A. SESPEÑE, MIT
Thesis Coordinator
College of Informatics

Additional Comments/Recommendations:

The chapter is well-organized and presents the data clearly, but several sections would benefit from more concise wording to avoid repetition. Strengthening academic tone by reducing informal expressions will improve overall readability. Consider breaking long paragraphs into smaller units to enhance flow and clarity.

IV. CERTIFICATION

I hereby certify that I have thoroughly reviewed and critiqued the thesis manuscript of the above-mentioned students, and that the necessary corrections and suggestions on grammar, spelling, structure, and overall language use have been provided.

Endorsement Letter

This is to certify that the Capstone 2 project entitled:

“HOACConnect: AN AUTOMATED HOMEOWNER’S ASSOCIATION FEE COLLECTION AND BUDGET TRANSPARENCY SYSTEM FOR MABUHAY HOMES 2000, BARANGAY PALIPARAN II, DASMARIÑAS CITY, CAVITE”

prepared and presented by the following students:

- Castillo, Mark John S.
- Copon, Raemel M.
- Rodriguez, Gio Iverson A.
- San Jose, Marj Celine A.

has been thoroughly reviewed and evaluated. The group has demonstrated readiness in both the **software implementation** and the **manuscript preparation**.

Accordingly, we hereby endorse the above-mentioned project and grant permission for the group to proceed to their **Final Defense Presentation**.

Sample Evaluation Instrument for Homeowner

HOAConnect: An Automated Homeowner's Association Fee Collection and Budget Transparency System for Mabuhay Homes 2000, Barangay Paliparan II, Dasmariñas, Cavite

Christian Greetings!

Hello! We are 4th-year students from the Information Technology program at Philippine Christian University – Dasmariñas, currently undertaking our Capstone Project as part of our academic requirements. Our project, entitled *HOAConnect: An Automated Homeowners' Association Fee Collection and Budget Transparency System for Mabuhay Homes 2000, Barangay Paliparan II, Dasmariñas City, Cavite*, is designed to streamline the collection of monthly dues, enhance record-keeping, and promote transparency in financial management for the Mabuhay Homes 2000 Homeowners' Association.

We are reaching out to invite you to participate as a respondent in our study. Your insights and feedback are invaluable to us, as they will help ensure that HOAConnect meets the needs of homeowners and HOA administrators effectively. By answering our questionnaire, you will significantly contribute to the success of our research. We assure you that all responses will be treated with strict confidentiality and used solely for academic purposes.

Thank you for your time and support!

The respondent's email (letanaanica744@gmail.com) was recorded on submission of this form.

* Indicates required question

I. FUNCTIONAL SUITABILITY - Degree to which a product or system provides functions that meet stated and implied needs when user under specified conditions.

Please rate your satisfaction with the following aspects of the system using the scale below:

- (5) **Very Effective** - The application fully meets and far exceeds more expectations.
- (4) **Effective** - The application fully meets and far exceeds expectations.
- (3) **Moderately Effective** - The application fully meets all expectations.
- (2) **Somewhat Effective** - The application does not meet all expectations.
- (1) **Not at all Effective** - The application fails to meet expectations to a significant degree in several areas.

1. How effective is the software in meeting your needs? *

- ☒ Five (5) - Very Effective
- ☐ Four (4) - Effective
- ☐ Three (3) - Moderately Effective
- ☐ Two (2) - Somewhat Effective
- ☐ One (1) - Not at all Effective

2. How effective are the results provided by the software in meeting your expectations? *

- ☒ Five (5) - Very Effective
- ☐ Four (4) - Effective
- ☐ Three (3) - Moderately Effective
- ☐ Two (2) - Somewhat Effective
- ☐ One (1) - Not at all Effective

3. How effectively does the software adhere to rules and regulations? *

- ☒ Five (5) - Very Effective
- ☐ Four (4) - Effective
- ☐ Three (3) - Moderately Effective
- ☐ Two (2) - Somewhat Effective
- ☐ One (1) - Not at all Effective

II. PERFORMANCE EFFICIENCY - Performance relative to the amount of resources used under stated conditions.

Please rate your satisfaction with the following aspects of the system using the scale below:

- (5) **Very Effective** - The application fully meets and far exceeds more expectations.
- (4) **Effective** - The application fully meets and far exceeds expectations.
- (3) **Moderately Effective** - The application fully meets all expectations.
- (2) **Somewhat Effective** - The application does not meet all expectations.
- (1) **Not at all Effective** - The application fails to meet expectations to a significant degree in several areas.

4. How effective is the system in providing prompt responses? *

- ☒ Five (5) - Very Effective
- ☐ Four (4) - Effective
- ☐ Three (3) - Moderately Effective
- ☐ Two (2) - Somewhat Effective
- ☐ One (1) - Not at all Effective

5. How effectively does the system utilize its resources? *

- ☒ Five (5) - Very Effective
- ☐ Four (4) - Effective
- ☐ Three (3) - Moderately Effective
- ☐ Two (2) - Somewhat Effective
- ☐ One (1) - Not at all Effective

6. How effective is the system in managing large amounts of information? *

- ☒ Five (5) - Very Effective
- ☐ Four (4) - Effective
- ☐ Three (3) - Moderately Effective
- ☐ Two (2) - Somewhat Effective
- ☐ One (1) - Not at all Effective

III. USABILITY - Degree to which a product or system can be used by specified users to achieve specified goals with effectiveness, efficiency and satisfaction in a specified context of use.

Please rate your satisfaction with the following aspects of the system using the scale below:

- (5) **Very Effective** - The application fully meets and far exceeds more expectations.
- (4) **Effective** - The application fully meets and far exceeds expectations.
- (3) **Moderately Effective** - The application fully meets all expectations.
- (2) **Somewhat Effective** - The application does not meet all expectations.
- (1) **Not at all Effective** - The application fails to meet expectations to a significant degree in several areas.

7. How effective is the system in accurately recognizing the information you input? *

- ☒ Five (5) - Very Effective
- ☐ Four (4) - Effective
- ☐ Three (3) - Moderately Effective
- ☐ Two (2) - Somewhat Effective
- ☐ One (1) - Not at all Effective

8. How effective is the system in terms of ease of learning and usability? *

- ☒ Five (5) - Very Effective
- ☐ Four (4) - Effective
- ☐ Three (3) - Moderately Effective
- ☐ Two (2) - Somewhat Effective
- ☐ One (1) - Not at all Effective

9. How effective is the system in minimizing the effort required to use it? *

- ☐ Five (5) - Very Effective
- ☒ Four (4) - Effective
- ☐ Three (3) - Moderately Effective
- ☐ Two (2) - Somewhat Effective
- ☐ One (1) - Not at all Effective

10. How effective is the system in helping you prevent errors? *

- ☒ Five (5) - Very Effective
- ☐ Four (4) - Effective
- ☐ Three (3) - Moderately Effective
- ☐ Two (2) - Somewhat Effective
- ☐ One (1) - Not at all Effective

11. How effective is the interface in providing an appealing and user-friendly design? *

- ☒ Five (5) - Very Effective
- ☐ Four (4) - Effective
- ☐ Three (3) - Moderately Effective
- ☐ Two (2) - Somewhat Effective
- ☐ One (1) - Not at all Effective

12. How effective is the system in facilitating your understanding of its usage? *

- ☒ Five (5) - Very Effective
- ☐ Four (4) - Effective
- ☐ Three (3) - Moderately Effective
- ☐ Two (2) - Somewhat Effective
- ☐ One (1) - Not at all Effective

IV. RELIABILITY - Degree to which a system, product or component performs specified functions under specified conditions for a specified period of time.

Please rate your satisfaction with the following aspects of the system using the scale below:

- (5) **Very Effective** - The application fully meets and far exceeds more expectations.
- (4) **Effective** - The application fully meets and far exceeds expectations.
- (3) **Moderately Effective** - The application fully meets all expectations.
- (2) **Somewhat Effective** - The application does not meet all expectations.
- (1) **Not at all Effective** - The application fails to meet expectations to a significant degree in several areas.

13. How effective have the improvements been in addressing issues within the software over time? *

- ☒ Five (5) - Very Effective
- ☐ Four (4) - Effective
- ☐ Three (3) - Moderately Effective
- ☐ Two (2) - Somewhat Effective
- ☐ One (1) - Not at all Effective

14. How effective is the system in being available whenever you need it? *

- ☒ Five (5) - Very Effective
- ☐ Four (4) - Effective
- ☐ Three (3) - Moderately Effective
- ☐ Two (2) - Somewhat Effective
- ☐ One (1) - Not at all Effective

15. How effective is the software in managing errors? *

- ☒ Five (5) - Very Effective
- ☐ Four (4) - Effective
- ☐ Three (3) - Moderately Effective
- ☐ Two (2) - Somewhat Effective
- ☐ One (1) - Not at all Effective

16. How effective is the software in recovering lost information after an issue occurs? *

- ☒ Five (5) - Very Effective
- ☐ Four (4) - Effective
- ☐ Three (3) - Moderately Effective
- ☐ Two (2) - Somewhat Effective
- ☐ One (1) - Not at all Effective

V. SECURITY - Degree to which a product or system protects information and data so that persons or other products or systems have the degree of data access appropriate to their types and level of authorization.

Please rate your satisfaction with the following aspects of the system using the scale below:

- (5) **Very Effective** - The application fully meets and far exceeds more expectations.
- (4) **Effective** - The application fully meets and far exceeds expectations.
- (3) **Moderately Effective** - The application fully meets all expectations.
- (2) **Somewhat Effective** - The application does not meet all expectations.
- (1) **Not at all Effective** - The application fails to meet expectations to a significant degree in several areas.

17. How effective is the software in preventing unauthorized access? *

- ☒ Five (5) - Very Effective
- ☐ Four (4) - Effective
- ☐ Three (3) - Moderately Effective
- ☐ Two (2) - Somewhat Effective
- ☐ One (1) - Not at all Effective

18. How effective is the system in preventing unauthorized changes to your information? *

- ☒ Five (5) - Very Effective
- ☐ Four (4) - Effective
- ☐ Three (3) - Moderately Effective
- ☐ Two (2) - Somewhat Effective
- ☐ One (1) - Not at all Effective

19. How effective is the system in maintaining a record of user activities? *

- ☒ Five (5) - Very Effective
- ☐ Four (4) - Effective
- ☐ Three (3) - Moderately Effective
- ☐ Two (2) - Somewhat Effective
- ☐ One (1) - Not at all Effective

20. How effective are the overall security features of the system? *

- ☒ Five (5) - Very Effective
- ☐ Four (4) - Effective
- ☐ Three (3) - Moderately Effective
- ☐ Two (2) - Somewhat Effective
- ☐ One (1) - Not at all Effective

Please provide further comments about your experience in using **HOAConnect: HOAConnect: An Automated Homeowner's Association Fee Collection And Budget Transparency System For Mabuhay Homes 2000, Barangay Paliparan II, Dasmariñas City, Cavite.** *

Kindly identify its Strong point/s to be enhanced and its weak points that need to be addressed for improvements.

The system is very functional and easy to use.

Do you have any thoughts on other Features/Functions that can be added to **HOAConnect: HOAConnect: An Automated Homeowner's Association Fee Collection And Budget Transparency System For Mabuhay Homes 2000, Barangay Paliparan II, Dasmariñas City, Cavite.** *

Kindly share any suggestions with us so we can better improve it.

The system works well.

Appendix Figure 8. Sample form President

Appendix H: Software Acceptance Form

SOFTWARE ACCEPTANCE FORM

Client Name Position: BENILDA A. MANSAT

Date: November 6, 2025

Department: MABUHAY HOMES 2000 DASMA 5 ASSOCIATION INC.

Title of the Study: HOA Connect: AN AUTOMATED HOMEOWNER'S ASSOCIATION FEE COLLECTION AND BUDGET TRANSPARENCY SYSTEM FOR MABUHAY HOMES 2000, BARANGAY PALIPARAN II, DASMARIÑAS CITY, CAVITE

Narrative Report: (to be filled out by the researchers)

The HOAConnect: An Automated Homeowner's Association Fee Collection and Budget Transparency System for Mabuhay Homes 2000, Barangay Paliparan II, Dasmariñas City, Cavite aims to modernize and simplify the fee collection process by automating monthly dues and offering online payment option through GCash and bank transfer. It enhances financial transparency by allowing all users to access updates on collected funds, project allocations, and expense reports. Additionally, the system enables the administrators to verify payments, issue receipts, record homeowners' information, and ensure transactions are properly recorded and traceable for greater accountability.

Implemented: ☒ YES

☐ NO

Reason: (to be filled out by the client)

The thesis project addresses many of the challenges we have long struggled with. The automated fee collection and transparency features make it easier for both the officers and the residents to track payments and understand where the funds are being allocated. The system not only simplifies our operations, but also builds trust within the community.

Objective

To develop and improve my technical skills while contributing to a professional environment, gaining hands-on experience, and taking on new challenges to grow in technology and design.

Technical Skills

- **Networking:** Skilled in using Cisco Packet Tracer for basic network setup, subnetting, VLANs, and routing.
- **Front-End Development:** Proficient in creating and designing responsive user interfaces using HTML, CSS, and JavaScript.
- **Software and Tools:** Hands-on experience in Canva and Figma for design, prototyping, and creating visual assets.
- **Hardware Technician:** Skilled in troubleshooting and repairing cellphones and laptops, including diagnostics, part replacement, and software setup.

Work Experience

- **Phone Technician** | Cmique Cellphone and Accessories Store

Philippine Christian University

College of Informatics

Seminars and Webinars Attended

- Introduction to Needs Assessments in Emergencies *kaya – Save the Children, Humanitarian Leadership Academy* | December 8, 2022
- Mastering GMAIL: Tips and Tricks for Efficient Email Management *PCU-D COI Computer Society's Tech Event 2023* | March 1, 2023
- How to Adapt in a World with Artificial Intelligence *PCU-D COI Computer Society's Tech Event 2023* | March 1, 2023

Email Address: raemel.gerard.copon10@gmail.com

Objective

Motivated IT student eager to learn and apply new technologies. Passionate about creating practical solutions and continuously improving technical and professional skills.

Technical Skills Programming

- **Proficient:** Java
- **Knowledgeable:** C#, C++, Python, HTML5, CSS3
- **Database:** MySQL, MongoDB
- **Tools:** IntelliJ IDEA, Visual Studio Code, Visual Studio, Figma
- **Technologies:** GitHub, Google Workspace, Microsoft Office, Arduino Uno

Work Experience

- **Commission Project Knovelty:** Assisted in developing system features and meeting project requirements. Contributed to implementation and testing tasks.

Objective

A highly adaptable and versatile professional seeking a role that capitalizes on a unique blend of skills: core backend development (PHP/MySQL), network infrastructure setup, and field IT maintenance, aiming to contribute to both software and hardware integrity.

Technical Skill

- **Full-Stack Development:** Proficient in designing responsive user interfaces using **HTML, CSS, and JavaScript**. Expertise in robust backend development, specifically utilizing **PHP (Vanilla)** and advanced **MySQL** for application building and database management (design, optimization, and administration).
- **Networking & Infrastructure:** Skilled in foundational network configuration, including **subnetting, VLANs, and routing**, with hands-on practice using **Cisco Packet Tracer**.
- **Hardware & IT Support:** Experienced technician in diagnosing, troubleshooting, and resolving hardware issues for PC, laptops and servers, including diagnostics, **part replacement**, and **software setup**.
- **Design & Prototyping:** Practical experience with design tools like **Canva and Figma** for creating visual assets, prototyping, and user interface design.

Work Experience

- **Freelance Outsourced IT Technician** | SERVUS TECHNOLOGIES, INC.
